

## Enhancing Nutrient Efficiency

At Sound Agriculture, we unleash the power within plants to grow food in a way that is more agile and resilient to changes in the environment. Our science-backed approach gives growers an easy and reliable way to improve efficiency and productivity each season.

Growers need new ways to improve yield and crop resilience while supporting a healthy ecosystem. Rather than adding more to the land, we've found ways to enhance the natural systems that already exist.

SOURCE™ is the only product that targets both nitrogen and phosphorus, nutrients that are crucial for healthy crop production. By fixing nitrogen and unlocking phosphorus, we are able to improve nutrient efficiency - resulting in higher yields and a better return on investment.

Increased Yield  
**7.5 bu/acre**

Consistent Results  
**83% win rate**

Flexible Application  
**V4 - R3**

## How SOURCE Works

SOURCE is applied as a foliar spray and activates microbes at the root zone that fix atmospheric nitrogen and unlock phosphate. When crops are able to take in these nutrients throughout the season, the result is healthier plants and improved yield.

Because SOURCE gives crops more access to nitrogen and phosphorus, growers see the effects of increased nutrition. These include:

Earlier, more uniform crop maturity

Healthier, more robust root systems

Less firing, more greenness within the canopy

Bigger ear size

Better grain fill and kernel count

Greater standability

Healthier plants

## Reliable Performance, Predictable Results

SOURCE performs consistently across all major corn producing areas in the US. Reliable results are attained in a variety of soil types and with different management practices. Strong performance is also seen when growers use sustainable management practices like conservation tillage, and when SOURCE is used on soils that have higher rates of organic matter.
